

POLYMORPHISM:

```
class Helper {

    static int Multiply(int a, int b)
    {

        // Returns product of integer numbers
        return a * b;
    }

    static double Multiply(double a, double b)
    {

        // Returns product of double numbers
        return a * b;
    }
}

class GFG {

    public static void main(String[] args)
    {

        System.out.println(Helper.Multiply(2, 4));
        System.out.println(Helper.Multiply(5.5, 6.3));
    }
}
```

```
class Helper {

    static int Multiply(int a, int b)
    {

        // Return product
        return a * b;
    }

    static int Multiply(int a, int b, int c)
    {

        // Return product
```

```
        return a * b * c;
    }
}

class GFG {

    public static void main(String[] args)
    {

        System.out.println(Helper.Multiply(2, 4));
        System.out.println(Helper.Multiply(2, 7, 3));
    }
}
```

Method Overriding

```
class Parent {

    void Print()
    {

        // Print statement
        System.out.println("parent class");
    }
}

class subclass1 extends Parent {

    void Print() {
        System.out.println("subclass1");
    }
}

class subclass2 extends Parent {

    void Print()
    {

        System.out.println("subclass2");
    }
}

class GFG {
```

```
public static void main(String[] args)
{

    Parent a;

    a = new subclass1();
    a.Print();

    a = new subclass2();
    a.Print();

}
}
```
